T.C.  $O(n)$   
S.C.  $O(1)$

problem  
Is Subsequence

pre-requisites  
2 pointer

difficulty  
**Easy**

est. time  
**10-15 min**

can be asked in...

**49%**  
Accuracy

# Statement

## Description

- Given two strings `s` and `t`, return `true` if `s` is a subsequence of `t`, or `false` otherwise.

I/P

`s = "abc", t = "ahbgdc"`

O/P

`true`

## Subsequence->

- string `s = "abc"`, can be formed removing by 0 or more chars of `t = "ahbgdc"`, so `s` is subsequence.
- from `t = "ahbgdc"` removing `'h','g','d'` gives `s = "abc"`.

# Intuition

- You can obviously go with **Recursion** but here we don't want all the possibility (count) of subsequence s in string t.
- We just need to see if 1 subsequence exists or not.

|    |   |   |   |   |    |            |
|----|---|---|---|---|----|------------|
| 0  | 1 | 2 | 3 | 4 | 5  | <b>idx</b> |
| "a | h | b | g | d | c" | <b>t</b>   |
| "a | - | b | - | - | c" | <b>s</b>   |

- from above pic, it is clear that if we can have a variable that keeps track of indices in S whose value we found in T & finally if that variable reaches end of S, we say S is subsequence of T.
- So idea is we use 1 variable to iterate t & 1 var. to iterate s & what is this technique called

**2 Pointer**

# Algorithm

- `int i = 0` (to iterate `t`)
- `int j = 0` (to iterate `s`)
- `iterate over 't'`  
    `if(t[i] == s[j]) j++;`
- `if(j == s.size()) return 1`  
    `else return 0`

# Dry Run

```
t = "ahbgdc"  
s = "abc"
```

| i | j | t[i] | s[j] | comment        |
|---|---|------|------|----------------|
| 0 | 0 | 'a'  | 'a'  | a==a; j++, i++ |
| 1 | 1 | 'h'  | 'b'  | h!=b; i++      |
| 2 | 1 | 'b'  | 'b'  | b==b; j++, i++ |
| 3 | 2 | 'g'  | 'c'  | g!=c; i++      |
| 4 | 2 | 'd'  | 'c'  | d!=c; i++      |
| 5 | 2 | 'c'  | 'c'  | c==c; j++, i++ |
| 6 | 3 | -    | -    | final state    |

here `j == s.size()` i.e. `j` reaches end of `s`, so `s` is  
subseq. of `t`  
`3 == 3`, return 1

we found all chars of `s` in `t` in order

```
class Solution {  
public:  
    bool isSubsequence(string s, string t) {  
  
        int j = 0;  
  
        for(int i = 0; i < t.size(); i++) {  
            if(s[j] == t[i]) {  
                j++;  
            }  
        }  
        return j == s.size();  
    }  
};
```
